

KEYSTONE

v1.0.0-rc8

TA-14 REGISTRY EVIDENCE RECORD & CLAIM-BOUNDARY MANIFEST

Governed Financial Execution Architecture

Claim owner / submitting authority	Gary Williams, Founder, Elias Systems Ltd
Registered object	Keystone v1.0.0-rc8
Object status	Frozen historical baseline
Claimed establishment date	22 August 2026
Evidence record date	23 August 2026
Visibility	Public

CAPABILITY ≠ AUTHORITY

Where the evidence ends, the claims end too.

Document purpose. This file is a compiled registry evidence record and claim-boundary manifest for the frozen Keystone v1.0.0-rc8 object. It summarizes the declared architecture, formal claims, test position, approved external attribution, explicit non-claims, known limitations, and successor conditions. It does not replace native runtime objects, raw test outputs, or counterpart-controlled evidence where those exist separately.

1. Object identification and governance purpose

Keystone is a governed financial-execution architecture developed by Elias Systems. It is designed for organisations using AI agents, automated systems, software services, or human operators to initiate or coordinate consequence-bearing financial actions. Keystone separates identity, authority and execution permission so that being capable of proposing or constructing a transaction does not itself create permission to execute it.

Intended governance effect. Before execution, Keystone evaluates whether the required authority, conditions and evidence are present at the relevant execution boundary and can withhold execution where those requirements are not established. The architecture also preserves provenance, decision evidence and execution records so that what was permitted, refused or escalated can be examined afterwards.

1.1 Related Elias governance-stack context

Keystone does not stand alone. It operates within the wider Elias Systems governance stack. Five Elias governance architectures have been separately registered on the TA-14 AI Governance Registry, spanning constitutional governance, trust/authority, LOVE-OS governance, Internal / External / Unified AI Governance, and FICSQP qualification/testing.

Boundary: Registry presence records architecture and provenance. It is not asserted here as TA-14 certification, regulatory approval, legal approval, or investment endorsement.

2. Formal claims of the frozen RC8 object

1. Keystone v1.0.0-rc8 separates identity, authority and execution permission as distinct governance states.
2. Keystone v1.0.0-rc8 does not treat technical capability, model output or possession of identity credentials as sufficient execution authority.
3. Keystone v1.0.0-rc8 requires a governed execution permission before a consequence-bearing financial action may proceed through its defined execution boundary.
4. Keystone v1.0.0-rc8 supports payload-bound execution authorisation so that permission is associated with the specific governed action under evaluation.
5. Keystone v1.0.0-rc8 applies fail-closed behaviour at defined governance boundaries where required execution conditions cannot be established.
6. Keystone v1.0.0-rc8 revalidates relevant execution conditions at the execution boundary rather than relying solely on an earlier authorisation state.
7. Keystone v1.0.0-rc8 preserves provenance and evidence relating to governed determinations and execution decisions.
8. Keystone v1.0.0-rc8 structurally prevents an AI component from independently creating the authority required to authorise its own financial execution.
9. The frozen Keystone v1.0.0-rc8 system-test suite recorded 256 successful tests out of 256 executed tests.
10. Keystone v1.0.0-rc8 remains a frozen historical baseline; identified trust-anchor and registration-continuity hardening belongs to a distinct successor release and is not represented as retrospectively solved within RC8.

3. Declared system-test position

Baseline	Keystone v1.0.0-rc8
----------	---------------------

Suite result	256 successful tests / 256 executed tests
Status	Frozen historical baseline
Interpretive boundary	The suite result is evidence for the defined RC8 test suite; it is not a claim of universal security, production certification, or absence of all defects.

Evidence relationship. This compiled record preserves the declared 256/256 position associated with the frozen RC8 object. Where raw test logs, fixtures, code packages or hashes are supplied separately, those native artifacts remain the stronger evidentiary objects and should be read together with this manifest.

4. Bounded external examination lineage

The external roles below are distinct. They are not represented as a joint examination, joint ownership, blanket certification, regulatory approval or investment endorsement. Each attribution is preserved within the wording approved by the relevant external party.

4.1 ANDEKS™ - independent assessment

Approved public attribution

ANDEKS™, represented by Andrey Ekhmenin, independently assessed the frozen Keystone v1.0.0-rc8 object under a defined assessment protocol and recorded an overall disposition of:

SUPPORTED WITHIN FROZEN SCOPE.

Keystone v1.0.0-rc8 remains a closed historical assessment baseline. Any successor release, materially changed evidence state, or genuinely separate interoperability/composition proposition constitutes a new assessment question and does not inherit the RC8 disposition automatically.

The ANDEKS™ assessment is not a blanket certification, production-readiness determination, regulatory or legal approval, investment endorsement, or standing conclusion for any successor release or separate assessment object.

ANDEKS™ has no equity interest in Keystone and has no fundraising, finder, investor-introduction or success-linked role in Keystone financing.

4.2 Harmonic by Solace - sovereign external evaluation boundary

Approved public attribution

Harmonic served as the sovereign external evaluation boundary used in the Keystone RC8 boundary examination. The frozen native RC8 requests were submitted directly to Harmonic's defined /api/evaluate interface without an RC9 intermediary, semantic adapter, or post-freeze accommodation, and the native request/response evidence was preserved exactly as returned for independent examination.

Any conclusion regarding what that examination establishes belongs to the resulting evidence and the defined proposition under examination. Harmonic's participation should not be represented as certification, endorsement, integrated interoperability, downstream enforcement, or independent establishment of the truth, reality, or present standing of Keystone-supplied predicates.

4.3 Michael Ciuman / Blaze Balance Engine Corp. - independent H4/H5 examination

Approved public attribution

Michael Ciuman / Blaze Balance Engine Corp. independently examined the frozen Keystone RC8 trust-anchor and registration-continuity behaviour. The resulting H4/H5 examination reproduced a bounded condition in which an unrelated K2 replacement could inherit a K1 checkpoint without authorised rotation. That finding remains attached to RC8 as a historical assessed condition and is not being retrospectively corrected or rewritten; any correction will exist only in a distinct successor release with its own evidence. The finding does not assert forgery, remote exploitability, live compromise or broader system compromise. Neither the independent review nor the H4/H5 finding constitutes an investment endorsement by Michael Ciuman or Blaze Balance Engine Corp.

Cross-role boundary. Bounded external examination roles. Not certification, regulatory approval or investment endorsement.

5. Explicit non-claims

- Keystone v1.0.0-rc8 is not claimed to constitute regulatory approval, legal approval, certification, production-readiness certification, or investment endorsement.
- Keystone v1.0.0-rc8 is not claimed to establish universal security, immunity from compromise, or prevention of every possible attack or misuse scenario.
- The RC8 record does not claim that trust-anchor or registration-continuity hardening is conclusively solved.
- The H4/H5 finding does not assert forgery, remote exploitability, live compromise, or broader system compromise.
- No bounded external examination of RC8 is claimed to establish blanket validation of Keystone, any successor release, or any proposition outside the specific scope, protocol, evidence and falsifiers examined.
- Harmonic's role is not claimed to constitute certification, endorsement, integrated interoperability, downstream enforcement, or independent establishment of the truth, reality or present standing of Keystone-supplied predicates.
- ANDEKS™'s RC8 disposition is not claimed to transfer automatically to any successor release, materially changed evidence state, or separate interoperability/composition proposition.
- Registration on the TA-14 AI Governance Registry is not claimed to constitute TA-14 certification, endorsement, regulatory approval or investment endorsement.

6. Known limitations, dependencies and unresolved questions

- The frozen Keystone v1.0.0-rc8 baseline contains a preserved H4/H5 trust-anchor and registration-continuity condition in which an unrelated K2 replacement could inherit a K1 checkpoint without authorised rotation.
- That condition remains attached to RC8 as a historical assessed finding and will not be retrospectively removed or rewritten. Any correction must exist in a distinct successor release with its own evidence and independent re-examination where applicable.
- Production financial connectivity and institutional sandbox qualification remain future-stage activities and are not established by the RC8 baseline.
- Live partner integration, production deployment, operational-scale stress testing and commercial onboarding remain dependent on successor implementation and qualification.
- External examinations associated with RC8 are proposition-bounded and evidence-bounded. Their findings do not automatically extend to changed implementations, successor releases, new environments or additional interoperability claims.
- Any successor release that materially changes the relevant trust, authority, execution or registration state constitutes a new evidentiary object and must establish its own standing rather than inheriting RC8 conclusions automatically.

7. Jurisdictional and standards context

Geographic / jurisdictional scope: Global, with initial commercial and deployment focus in the United Kingdom and other jurisdictions subject to applicable local law, regulatory requirements and deployment context.

Relevant regulatory / standards context: EU AI Act; UK AI governance and financial-services regulatory context; NIST AI RMF; ISO/IEC 42001; ISO/IEC 27001; PCI DSS where card-payment environments are in scope; UK GDPR / GDPR where personal-data processing is applicable.

Scope boundary: Listing a regulation or standard establishes relevance of context only. It does not establish conformity, approval, certification or legal sufficiency.

8. Submitting authority and authority boundary

Authority evidence / explanation

Gary Williams is the Founder of Elias Systems Ltd and the originating architect and claim owner for Keystone v1.0.0-rc8. This record is submitted in that capacity and under authority to describe and register the Elias Systems architecture and its preserved technical and evidentiary record. This authority does not extend to ANDEKS™, Harmonic, or Blaze Balance Engine Corp.; their independent roles, evidence and findings remain under their own sovereign authority and are referenced only within their approved bounded attribution.

9. Evidence index and relationship map

Ref	Evidence object / statement	Control / owner	Relationship to RC8
E-01	Keystone v1.0.0-rc8 object identification and frozen baseline metadata	Elias Systems	Defines registered object and historical baseline.
E-02	Declared RC8 system-test result: 256/256	Elias Systems / native test artifacts where separately supplied	Supports the bounded system-test claim only.
E-03	ANDEKS™ approved public attribution and SUPPORTED WITHIN FROZEN SCOPE disposition	ANDEKS™ / Andrey Ekhmenin	Independent assessment result within frozen scope.
E-04	Harmonic approved role attribution; direct /api/evaluate native request/response boundary	Harmonic by Solace / Tim Zlomke	Defines sovereign external evaluation-boundary role; no blanket interoperability claim.
E-05	Blaze H4/H5 approved finding and non-endorsement boundary	Michael Ciuman / Blaze Balance Engine Corp.	Preserves bounded trust-anchor / registration-continuity condition as historical RC8 evidence.
E-06	Related TA-14 governance-stack registration context	TA-14 registry entries / Elias Systems submissions	Provides provenance context only; not certification or endorsement.

10. Evidence preservation and successor rule

Frozen-baseline rule. RC8 is preserved as the historical object examined. Findings attached to RC8 are not silently removed, rewritten or inherited by a successor.

Successor rule. A successor release must exist as a distinct reviewable object with its own version identity, evidence, test record and, where relevant, independent re-examination. No successor release automatically inherits RC8 findings or dispositions.

Evidence hierarchy. Where this manifest summarizes a native artifact, the native artifact controls the technical fact. Where this manifest reproduces an externally approved public attribution, the approved wording controls the public characterization of that party's role.

11. Claim-owner attestation

I attest that this registry evidence record is intended to represent the Keystone v1.0.0-rc8 claim boundary faithfully, including the preserved adverse H4/H5 condition, the bounded external examination roles, and the explicit limitations stated above. It is not intended to enlarge any independent finding beyond its approved scope.

Gary Williams
